

A Paired summary plot

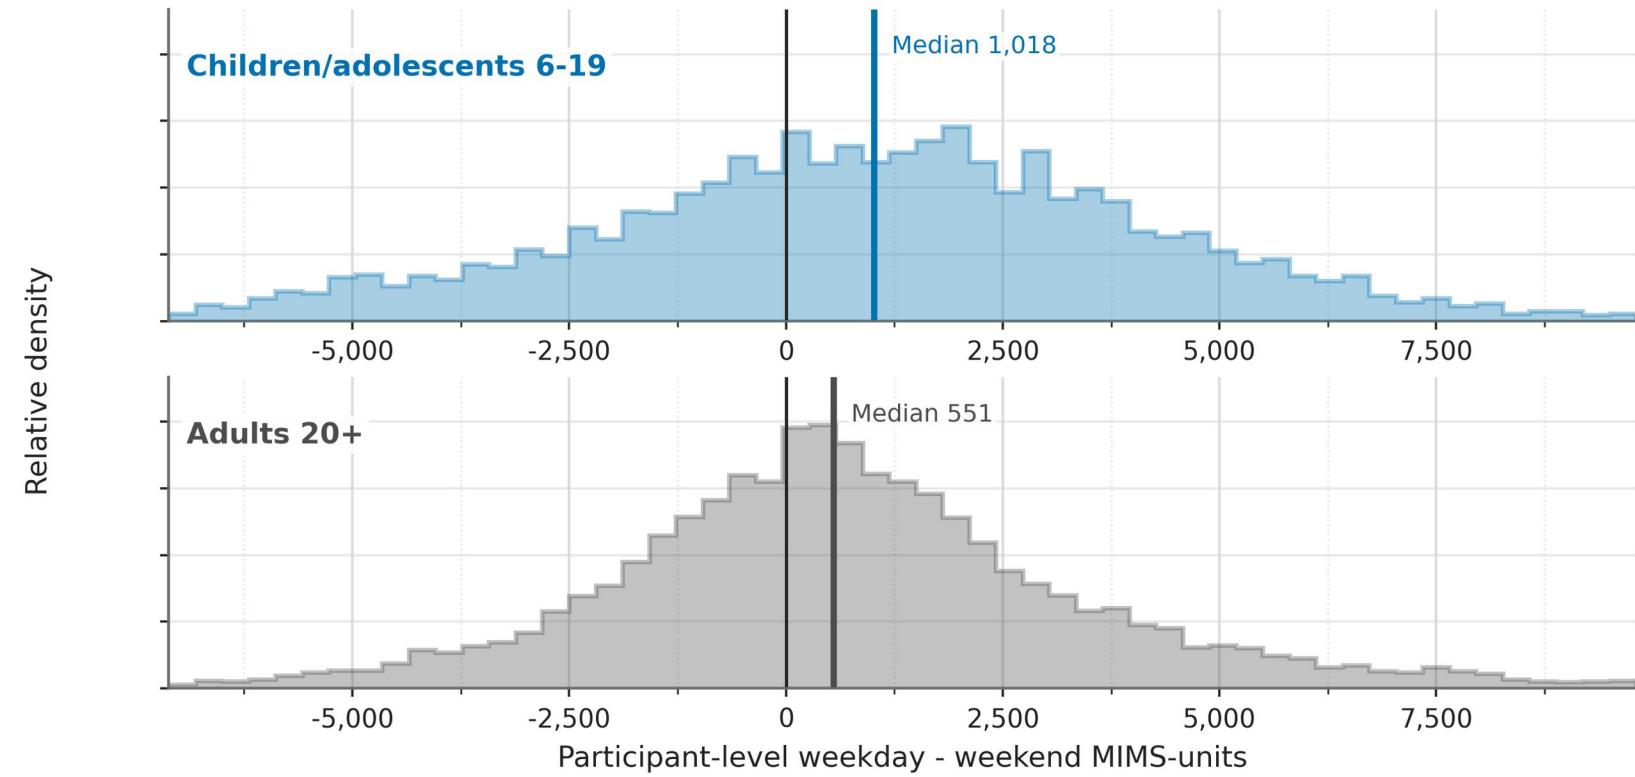

Weekday and weekend-day physical activity by sample

Points show weighted estimates; horizontal intervals show 95% confidence intervals. MIMS = Monitor-Independent Movement Summary units. The x-axis is zoomed to make the paired day-type estimates readable and starts at 12,302 MIMS-units, not zero; values are shown in the original metric units.

B Distribution plot

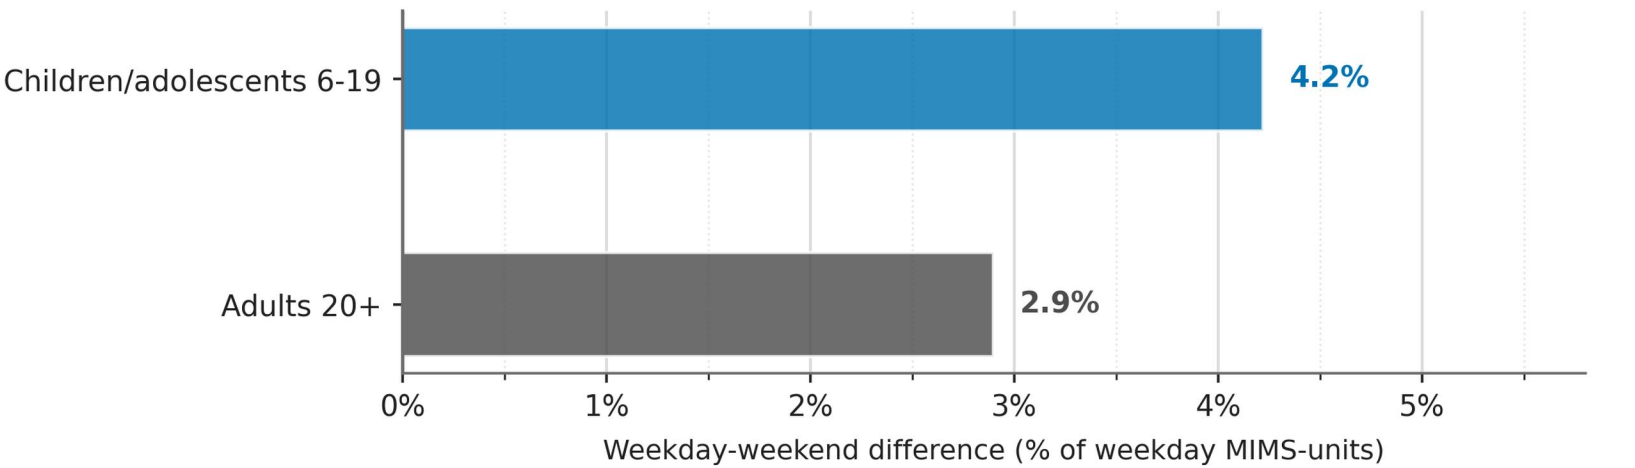

Distribution of individual weekday-weekend differences

Distributions use unweighted participant-level differences and show the central 98% of values to keep the distribution readable; median lines are calculated from all retained participants. Positive values indicate higher weekday activity.

C Conditional bar-chart example

Conditional bar-chart example: percentage difference by sample

This bar version is a conditional alternative because the percentage difference has a meaningful zero and the message is magnitude from zero. Prefer point-range or dot plots when uncertainty, distribution, or precise comparisons are the main message.
