

Decision support for visualising accelerometer-derived movement behaviour data

Decision-tree component for direct displays of accelerometer metrics

Scope

Use for: accelerometer signals, classified behaviours, summary metrics, and movement-behaviour compositions
Outside scope: model coefficients, predictions, and other model-result displays

Guided questions

Framework questions are translated into decision-tree choices.

1 Metric form

signal, classified behaviour, summary, composition

2 Research question

How much? How important? How often? How long? When?

3 Detail shown

one observation, many observations, summary

4 Comparison

none, groups, time, conditions

5 Refinements

uncertainty, crowding, context, audience

Adaptive decision rules

skip non-applicable questions | fill defaults | validate answers

Research question → recommendation branch

How much?

volume and intensity
line/profile, point-range, dot plot, heatmap

How important?

proportion
pie/doughnut, 100% stacked bar, ternary

How often?

frequency
bar/dot plot, event raster, frequency profile

How long?

duration
histogram/density, ECDF, box/violin

When?

point in time
timeline, time heatmap, time profile

Relationship

with another continuous measure
scatter, hexbin, 2D density

Output

primary recommendation | alternatives or cautions | design notes | code signposts
